Math 213 - Maximum and Minimum Values,

Unit II: Functions of Several Variables

13.3-4 Lecture 11: Velocity and Acceleration

- 14.1 Lecture 12: Functions of Several Variables
- 14.3 Lecture 13: Partial Derivatives
- 14.4 Lecture 14: Linear Approximation
- 14.5 Lecture 15: Chain Rule, Implicit Differentiation
- 14.6 Lecture 16: Directional Derivatives and the Gradient
- 14.7 Lecture 17: Maximum and Minimum Values, I
- 14.7 Lecture 18: Maximum and Minimum Values, II
- 14.8 Lecture 19: Lagrange Multipliers
- 15.1 Double Integrals
- 15.2 Double Integrals over General Regions Exam II Review

Learning Goals

- Know how to find a critical point of a function of two variables
- Know how to use the second derivative test to determine whether a given critical point is a local maximum, a local minimum, or a saddle point
- Know how to use the second derivative test to solve simple maximization and minimization problems

Review of Calculus I

If y = f(x) then local maxima and minima occur at *critical points a* where f'(a) = 0 or f'(a) does not exist. There are two main tests:

First Derivative Test:

- If f'(a) = 0 and f'(x) changes from to + then f(a) is a local minimum value
- If f'(a) = 0 and f'(x) changes from + to at x = a, then f(a) is a local maximum value
- If f'(a) = 0 but f'(x) does not change sign at x = a, then f(a) is neither a local maximum value nor a local minimum value

イロト イポト イヨト イヨト

Review of Calculus I

If y = f(x) then local maxima and minima occur at *critical points a* where f'(a) = 0 or f'(a) does not exist. There are two main tests:

Second Derivative Test:

- If f'(a) = 0 and f''(a) > 0, then f(a) is a local minimum value
- If f'(a) = 0 and f''(a) < 0, then f(a) is a local maximum value
- If f'(a) = 0 but f''(a) = 0, the test is indeterminate

イロト イポト イヨト イヨト

Preview of Calculus III $x^{2}+x^{2}$

There is *no* "first derivative test" and instead the nature of the critical point depends on the *Hessian matrix*

$$\operatorname{Hess}(f)(a,b) = \begin{pmatrix} f_{xx}(a,b) & f_{xy}(a,b) \\ f_{yx}(a,b) & f_{yy}(a,b) \end{pmatrix},$$

and its determinant

$$D = f_{xx}(a,b)f_{yy}(a,b) - f_{xy}(a,b)^2$$

In the graphs at left:

• $\operatorname{Hess}(f)(0,0) = \begin{pmatrix} 2 & 0 \\ 0 & 2 \end{pmatrix}$ D = +4

• Hess
$$(f)(0,0) = \begin{pmatrix} -2 & 0 \\ 0 & -2 \end{pmatrix}$$
, $D = +4$

• Hess
$$(f)(0,0) = \begin{pmatrix} 2 & 0 \\ 0 & -2 \end{pmatrix}$$
 $D = -4$

Local and Absolute Extrema

A function f(x, y) has a local maximum at (a, b) if $f(x, y) \le f(a, b)$ for all (x, y) near (a, b).

A function f(x, y) has a local minimum at (a, b) if $f(x, y) \ge f(a, b)$ for all (x, y) near (a, b).

What does it mean for a function to have an absolute maximum value (resp. absolute minimum value) at (a, b)?

イロト 不得 トイヨト イヨト

Hunting License for Local Extrema

Theorem If f has a local maximum or a local minimum at (a, b), and the first-order partial derivatives of f exist there, then

$$f_x(a,b) = f_y(a,b) = 0.$$

A value of (a, b) where $f_x(a, b)$ and $f_y(a, b)$ are either zero or do not exist is called a *critical point* for the function f.

Critical Points

To find the critical points of a function f(x, y), you need to solve for the values (a, b) that make *both* $f_x(a, b)$ and $f_y(a, b)$ equal to zero.

Examples

- 1 Find all the critical points of the function $f(x, y) = x^3 3x + 3xy^2$
- 2 Find the critical points of $f(x, y) = x^2 + y^4 + 2xy$
- **3** Find the critical points of $f(x, y) = e^x \cos y$

イロト イポト イヨト イヨト

Second Derivative Test

Second Derivatives Test Suppose *f* has second partial derivatives continuous on a disc at (a, b), and $f_x(a, b) = f_y(a, b) = 0$. Let

$$D = \begin{vmatrix} f_{xx}(a,b) & f_{xy}(a,b) \\ f_{xy}(a,b) & f_{yy}(a,b) \end{vmatrix}$$

- (a) If D > 0 and $f_{xx}(a, b) > 0$, then f(a, b) is a local minimum
- (b) If D > 0 and $f_{xx}(a, b) < 0$, then f(a, b) is a local maximum
- (c) If D < 0, then f(a, b) is a saddle point (neither a maximum nor a minimum)

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

- (a) If D > 0 and $f_{xx}(a, b) > 0$, then f(a, b) is a local minimum
- (b) If D > 0 and $f_{xx}(a, b) < 0$, then f(a, b) is a local maximum
- (c) If D < 0, then f(a, b) is a saddle point (neither a maximum nor a minimum)

3

Classify the critical points of the following functions:

1
$$f(x,y) = x^3 - 3x + 3xy^2$$

2 $f(x,y) = x^2 + y^4 + 2xy$
3 $f(x,y) = \sin(x)\sin(y)$

Maximum and Minimum Problems

- 1 Find the shortest distance from the point (2, 0, -3) to the plane x + y + z = 1.
- 2 Find the point on the plane $x 2y^3z = 6$ that is closest to the point (0, 1, 1).

Review of Calculus I

The Closed Interval Method To find the *absolute* maximum and minimum values of a continuous function on a closed interval [a, b]:

1 Find the values of f at the critical numbers of f in [a, b]

- 2 Find the values of *f* at the endpoints of the interval
- 3 The largest of the values from steps 1 and 2 is the absolute maximum of f on [a, b]; the smallest of these values is the absolute minimum of f on [a, b].

For functions of two variables:

1 The "closed interval" on the line is replaced by a "closed set" in the plane

2 The boundary of a closed set is a *curve* rather than just two points

Otherwise, the idea is much the same!

The Extreme Value Theorem

Extreme Value Theorem If f is continuous on a closed, bounded set D in \mathbb{R}^2 , then f attains an absolute maximum value $f(x_1, y_1)$ and an absolute minimum value $f(x_2, y_2)$ at some points (x_1, y_1) and (x_2, y_2) in D.

Practical fact: These extreme values occur either in the interior of *D*, where the second derivative test works, or on the boundary of *D*, where the search for maxima and minima can be reduced to a Calculus I problem.

Summary

- We reviewed how to find local maxima and minima of functions of one variable
- We learned how to find local maxima, minima, and saddle points for functions of two variables using the gradient ∇f (to find critical points) and the determinant of the Hessian matrix (to classify the critical points as maxima, minima, or saddle points)
- We learned about the Extreme Value Theorem for a continuous function of two variables on a closed, bounded set
