### Math 213 - Quadric Surfaces

Peter A. Perry

University of Kentucky

September 11, 2019

### Reminders

- Access your WebWork account only through Canvas!
- Homework A3 on section 12.5 is due tonight
- Homework A4 on section 12.6 is due Friday
- Quiz # 2 on sections 12.3-12.4 takes place in tomorrow's recitation

- 12.1 Lecture 1: Three-Dimensional Coordinate Systems
- 12.2 Lecture 2: Vectors in the Plane and in Space
- 12.3 Lecture 3:The Dot Product
- 12.4 Lecture 4:The Cross Product
- 12.5 Lecture 5: Equations of Lines and Planes, I
- 12.5 Lecture 6: Equations of Lines and Planes, II
- 12.6 Lecture 7: Surfaces in Space
- 13.1 Lecture 8: Vector Functions and Space Curves
- 13.2 Lecture 9 Derivatives and Integrals of Vector Functions Lecture 10: Exam I Review

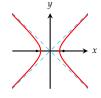

### Learning Goals

- Recall quadratic curves from MA 114
- Identify and graph cylinders
- Find traces of quadric surfaces
- Identify and graph quadric surfaces

•0

A *quadratic curve* is the graph of a second-degree equation in two variables taking one of the forms

$$Ax^2 + By^2 + J = 0$$
,  $Ax^2 + By^2 + Jy = 0$ 

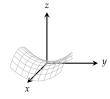

In MA 114 you learned about the following *quadratic* curves:

- The ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$  with foci  $(\pm c, 0)$ , where  $a^2 = b^2 + c^2$
- The parabola  $x^2 = 4py$  with focus at (0, p) and directrix at y = -p
- The hyperbola  $\frac{x^2}{a^2} \frac{y^2}{b^2} = 1$  with foci at  $(\pm c, 0)$  where  $c^2 = a^2 + b^2$

00

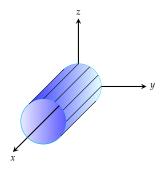

In MA 213 we'll study *quadric surfaces* in three dimensional space, such as:

- Cylinders which consist of all lines that are parallel to a given line and pass through a given plane curve
- Elliptic Paraboloids which will model functions with local maxima or minima
- Hyperbolic Paraboloids ("saddles")
  which model a new kind of critical
  point, called a saddle point, for
  functions of two variables

### Cylinders

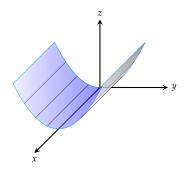

A cylinder is a surface that consists of all lines (called rulings) that are parallel to a given line and pass through a given plane curve.

**Example 1**:  $y^2 + z^2 = 1$ 

- What is the given curve?
- What is the given line?

A cylinder is a surface that consists of all lines (called rulings) that are parallel to a given line and pass through a given plane curve.

**Example 2**:  $z = y^2$ 

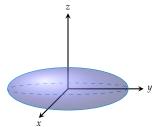

- What is the given curve?
- What is the given line?

### Quadric Surfaces

A **quadric surface** is the graph of a second-degree equation in x, y, and z taking one of the standard forms

$$Ax^2 + By^2 + Cz^2 + J = 0$$
,  $Ax^2 + By^2 + Iz = 0$ 

We can graph a quadric surface by studying its *traces* in planes parallel to the x, y, and z axes. The traces are always quadratic curves!

In what follows we'll use the method of traces to graph the *ellipsoid* 

$$x^2 + \frac{y^2}{4} + \frac{z^2}{2} = 1$$

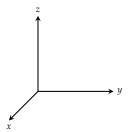

### Interlude: A Buddhist Parable

A group of blind men heard that a strange animal, called an elephant, had been brought to the town, but none of them were aware of its shape and form. Out of curiosity, they said: "We must inspect and know it by touch, of which we are capable". So, they sought it out, and when they found it they groped about it. In the case of the first person, whose hand landed on the trunk, said "This being is like a thick snake". For another one whose hand reached its ear, it seemed like a kind of fan. As for another person, whose hand was upon its leg, said, the elephant is a pillar like a tree-trunk. The blind man who placed his hand upon its side said, "elephant is a wall". Another who felt its tail, described it as a rope. The last felt its tusk, stating the elephant is that which is hard, smooth and like a spear.

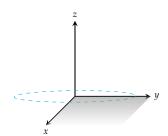

$$x^2 + \frac{y^2}{4} + \frac{z^2}{2} = 1$$

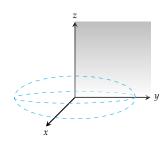

$$x^2 + \frac{y^2}{4} + \frac{z^2}{2} = 1$$

Trace in the *xy*-plane (z = 0):

$$x^2 + \frac{y^2}{4} = 1$$

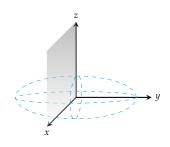

$$x^2 + \frac{y^2}{4} + \frac{z^2}{2} = 1$$

Trace in the *xy*-plane (z = 0):

$$x^2 + \frac{y^2}{4} = 1$$

Trace in the *yz*-plane (x = 0):

$$\frac{y^2}{4} + \frac{z^2}{2} = 1$$

$$x^2 + \frac{y^2}{4} + \frac{z^2}{2} = 1$$

Trace in the *xy*-plane (z = 0):

$$x^2 + \frac{y^2}{4} = 1$$

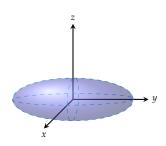

Trace in the *yz*-plane (x = 0):

$$\frac{y^2}{4} + \frac{z^2}{2} = 1$$

Trace in the *xz*-plane (y = 0):

$$x^2 + \frac{z^2}{2} = 0$$

$$x^2 + \frac{y^2}{4} + \frac{z^2}{2} = 1$$

Trace in the *xy*-plane (z = 0):

$$x^2 + \frac{y^2}{4} = 1$$

Trace in the *yz*-plane (x = 0):

$$\frac{y^2}{4} + \frac{z^2}{2} = 1$$

Trace in the *xz*-plane (y = 0):

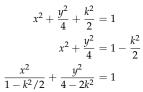

$$x^2 + \frac{z^2}{2} = 0$$

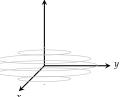

It often helps to find the traces in planes *parallel* to the *xy*, *xz*, or *yz* planes.

$$x^2 + \frac{y^2}{4} + \frac{z^2}{2} = 1$$

Trace in planes z = k:

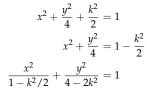

- Traces are ellipses
- No trace if  $|k| > \sqrt{2}$

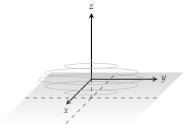

It often helps to find the traces in planes *parallel* to the *xy*, *xz*, or *yz* planes.

$$x^2 + \frac{y^2}{4} + \frac{z^2}{2} = 1$$

Trace in planes z = k:

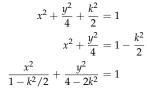

- Traces are ellipses
- No trace if  $|k| > \sqrt{2}$

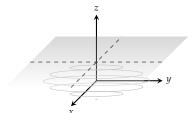

It often helps to find the traces in planes *parallel* to the *xy*, *xz*, or *yz* planes.

$$x^2 + \frac{y^2}{4} + \frac{z^2}{2} = 1$$

Trace in planes z = k:

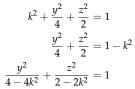

- Traces are ellipses
- No trace if  $|k| > \sqrt{2}$

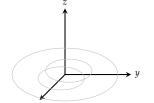

It often helps to find the traces in planes *parallel* to the *xy*, *xz*, or *yz* planes.

$$x^2 + \frac{y^2}{4} + \frac{z^2}{2} = 1$$

Trace in planes x = k:

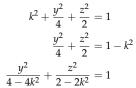

- Traces are ellipses
- No trace if |k| > 1

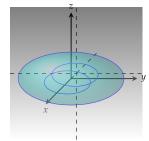

It often helps to find the traces in planes *parallel* to the *xy*, *xz*, or *yz* planes.

$$x^2 + \frac{y^2}{4} + \frac{z^2}{2} = 1$$

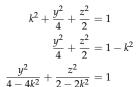

- Traces are ellipses
- No trace if |k| > 1

It often helps to find the traces in planes *parallel* to the *xy*, *xz*, or *yz* planes.

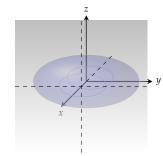

$$x^2 + \frac{y^2}{4} + \frac{z^2}{2} = 1$$

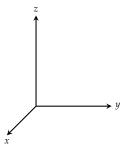

- Traces are ellipses
- No trace if |k| > 1

# Elliptic Paraboloid

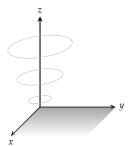

We'll use the method of traces to graph the surface

$$z = x^2 + y^2$$

We'll use the method of traces to graph the surface

$$z = x^2 + y^2$$

Traces in planes z = k:

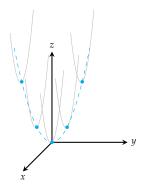

$$x^2 + y^2 = k$$

- No traces below z = 0
- Traces are circles of radius  $\sqrt{k}$  and center (0,0,k)

# Elliptic Paraboloid

We'll use the method of traces to graph the surface

$$z = x^2 + y^2$$

Traces in planes y = k:

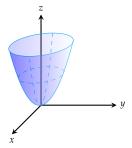

$$x^2 + k^2 = z$$

- No restriction on traces
- Traces are upward parabolas with vertex  $(0, k, k^2)$

# Elliptic Paraboloid

We'll use the method of traces to graph the surface

$$z = x^2 + y^2$$

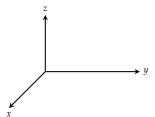

Putting it all together...

- Traces parallel to xy plane are circles
- Traces parallel yz or xz plane are parabolas

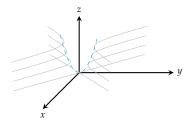

We'll use the method of traces to graph the surface

$$z = y^2 - x^2$$

We'll use the method of traces to graph the surface

$$z = y^2 - x^2$$

Traces in plane z = k:

00000000

$$y^2 - x^2 = k$$

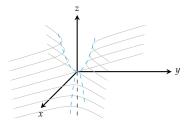

Hyperbolas:

• Opening in the y direction, k > 0

We'll use the method of traces to graph the surface

$$z = y^2 - x^2$$

Traces in plane z = k:

$$y^2 - x^2 = k$$

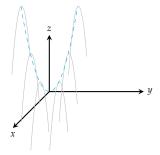

Hyperbolas:

- Opening in the y direction, k > 0
- Opening in the x direction, k < 0

We'll use the method of traces to graph the surface

$$z = y^2 - x^2$$

Traces in plane y = k:

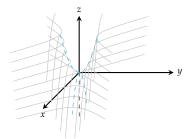

$$z = k^2 - x^2$$

Downward parabolas, vertex at  $(k^2, 0)$ 

We'll use the method of traces to graph the surface

$$z = y^2 - x^2$$

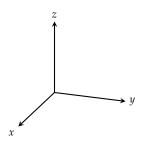

Putting it all together...

- Traces parallel to xy plane are hyperbolas
- Traces parallel to xz plane are downward parabolas

# Hyperboloid of One Sheet

We'll use the method of traces to graph the surface  $x^2 + y^2 - z^2 = 1$ .

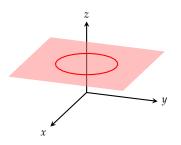

Rewrite the equation as:

$$x^2 + y^2 = 1 + z^2$$

What are the traces in the plane z = k?

We'll use the method of traces to graph the surface  $x^2 + y^2 - z^2 = 1$ .

Rewrite the equation as:

$$x^2 + y^2 = 1 + z^2$$

What are the traces in the plane z = k?

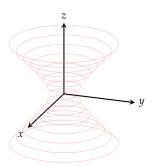

Equation: 
$$x^2 + y^2 = 1 + k^2$$

Curve: Circles with center at (0,0,k) of radius  $\sqrt{1+k^2}$ 

# Hyperboloid of One Sheet

We'll use the method of traces to graph the surface  $x^2 + y^2 - z^2 = 1$ .

Rewrite the equation as:

$$x^2 + y^2 = 1 + z^2$$

What are the traces in the plane z = k?

Equation: 
$$x^2 + y^2 = 1 + k^2$$

Curve: Circles with center at (0,0,k) of radius  $\sqrt{1+k^2}$ 

Surface: hyperboloid of one sheet whose axis of symmetry is the z axis

### Summary

- We recalled the equations and graphs of ellipses, parabolas, and hyperbolas from MA 114
- We learned how to graph equations of cylinders like  $z = y^2$  or  $x^2 + z^2 = 1$
- We learned how to find *traces* of quadric surfaces by restricting to planes x = h, y = k, or  $z = \ell$
- We learned how to visualize a quadric surface given its traces
- We discussed four important quadric surfaces:
  - The ellipsoid (example:  $x^2/9 + y^2/4 + z^2 = 1$ )
  - The elliptic paraboloid (example:  $z = x^2 + y^2$ )
  - The "saddle" (example:  $z = x^2 y^2$ )
  - The hyperboloid of one sheet (example:  $x^2 + y^2 z^2 = 1$ )

#### Homework

- Re-read section 12.6 and continue work on webwork A4 (due Friday)
- Read and study section 13.1 on vector functions and space curves
- Prepare for tomorrow's recitation on section 12.6
- Prepare for tomorrow's quiz on sections 12.3-12.4
